

Consistency

Conditioning Cotton Made Easy Through Gintex™ III's *Fiber Treatment System*

Features

- ◆ New top feed can be easily installed to any automatic feeder
- ◆ Combines bounded moisture and Gintex's conditioning agents
- ◆ Does not require communication with internal programming
- ◆ Requires only air, water and electricity.
- ◆ Adjustable self cleaning, non drip spray nozzles
- ◆ Reduced cost of application

Collaboration with USDA Textile Lab Yields a Superior Gintex III Formulation

In cooperation with USDA's test facility at Clemson University, we have redefined the term conditioning of cotton. Today's GINTEX III offers improved penetration of moisture and its conditioning agents. As a result we have enhanced the mechanics of the older formulation while tapping into nature's correlation between moisture and fiber strength.

Why Condition Cotton? Gintex™ III *Cotton Fiber Conditioner* is a non oil based/non silicon based *Fiber Conditioner* formulated to relax and improve the opening of cotton fibers. With Gintex, fibers move freely in the direction intended. Foreign matter and fibers separate easily reducing fiber damage caused by a harsh processing environment. A uniform flow of cotton improves processing efficiencies and increases yarn quality.

- ◆ Those Mills which push fiber to their limits during fiber preparation and spinning will **benefit the greatest by reducing waste from 0.5 to 1.2%** (increasing turnout of yarn with the same pounds of raw material).
- ◆ Cotton Mills that measure a high degree of variation in processing efficiencies and yarn quality resulting from cotton related problems **can now** be stabilized to maintain consistent quality and output of yarn.
- ◆ Naturally, 100% cotton yarns both Open End and Ring Spun measure a higher degree of improvement in yarn quality. The higher the count the greater the impact on red flags, slub cuts, and ends down.
- ◆ Are you prepared for **Sticky Cotton?** Gintex's new sticky cotton formulation will help remove trash particles and eliminate tackiness associated with honey dew infested cotton.
- ◆ If you or your customer experience poor weaving efficiencies or a high level of seconds as a result of trash related problems Gintex III Fiber Treatment System will make the difference. *"Since we started Gintex III on our Optimix we have not had a single complaint from our cloth room"*

If you can tract it we can guarantee it!
